Category:Video games developed in Poland Category:Windows games Category:Windows-only gamesQ: Get  
specific chars from string I have a string, I want to get the first n chars of this string and put them in a new string.  
For example: I have string text = "hello"; I want to get string result = "hell"; This is the code I used int length =  
text.Length; var firstChars = text.Substring(0,length/2); var secondChars = text.Substring(length/2,length/2); I know  
there are other ways, but I want to know if there is a better way to do this, because I am using a very large string,  
and I am afraid the execution time could become very slow. A: Maybe something like this? var result =  
text.Substring(0, text.Length/2); or even shorter if text starts with newline character: var result = text.Substring(0,  
text.LastIndexOf(" ")); Q: Google App Engine Django & CommonDB.EvaluationError: get() argument of  
EvaluationService.Get() must be a string or a RegisteredModel, got 'NoneType' I have a Django app on Google  
App Engine which has the following code in a handler: from google.appengine.ext import webapp from  
google.appengine.ext.webapp import template from os.path import dirname, join from os.path import abspath  
import datetime import common.cron\_template class RequestHandler(webapp.RequestHandler): def get(self):  
filename = os.path.join(dirname(\_\_file\_\_), 'conf', 'global.yaml') global\_conf = open(filename, 'r').read()  
common\_cron\_template.common\_cron\_template(global\_conf) self.response.write('OK') def main(): application
