Features of Robot Structural Analysis Professional
Structural Analysis Professional is one of the leading software for structural analysis. Based on the structure analysis, it makes the structural engineer more accurate during the design task. This software is different from any other software because it has a professional interface and its entire design process is aided by its powerful drag-and-drop function. Furthermore, Robot Structural Analysis Professional is fully integrated with other Autodesk design applications and software suites. This software is equally capable of doing 2D and 3D structural analysis. Its 3D analysis capabilities include use of rib, shear tie and skin friction equations.

Autodesk Robot Structural Analysis Professional 2020 Pro Edition is a user-friendly application that allows the engineer to design their bridge structures properly. Based on the structural analysis, this software will provide enough detailed information that is required for the detailed design. With the help of this software, you can easily design the bridge models. Also, it can analyze the structural details like the span, height, width, location, material, and so on. Furthermore, it is very easy to use this software and allow you to design bridges on a simple view of the design. The professional interface allows you to work and design on the 2D or 3D models. This software has a very powerful measurement tool. It provides the accurate values for the structural details like span, height, width, and so on. You can easily measure the material details for the span. This software is also intelligent enough to measure the material details for the entire structure and provides you the accurate values for every part of the design. Moreover, it has a very powerful and intelligent design tool to provide the accurate width, depth and height for every span. You can easily measure every span to get the accurate values for every span. This software provides the basic and advanced analyses like bending and torsion analysis. You can also carry out the analysis for the bearing and cantilever bridge design. In addition, the software performs the advanced design and analysis that includes the HCM, pile driving, shear and wind analysis and so on. You can measure all the permanent deformation details like deflections, shrinkage and so on. In addition, it also provides information about all the active and

passive materials used on your bridges like aggregate, reinforcement, fillers, polymers and so on. To add to its usefulness, you can easily check and
