My Teams LATEST COMMENTS Chef's XML Schema Quality Checker is a program which takes as input an XML Schema written in the W3C XML schema language and diagnoses improper uses of the schema language. Where the appropriate action to correct the schema is not obvious, the diagnostic message may include a suggestion about how to make the fix. For Schemas which are composed of numerous schema documents connected via or element information items, a full schema-wide checking is performed. The tool can also be run in batch mode to quality check multiple XML schemas in a single run. Take XML Schema Quality Checker for a test drive to see how useful it can be for you!The objective of this proposal is to examine the regulation of glucocorticoid receptors (GRs) in muscle. Glucocorticoids (GCs) are major anti-inflammatory agents. GCs interact with specific intracellular receptors. Two of these receptors in particular, GRs and mineralocorticoid receptors (MRs), play crucial roles in the regulation of inflammation. GCs induce a rapid rise in cytosolic calcium that activates the protein kinase, PKB/Akt, which in turn phosphorylates and inhibits GRs. Because inflammation is a major cause of muscle weakness, there is a need to better understand the regulation of GRs in muscle. This study will examine the question of how GCs affect muscle. A gene transfer approach will be used to overexpress proteins that act as GR ligands in muscle. The proposed studies will examine which proteins are required to observe increased GR function in muscle. This question will be addressed by using specific antibodies to knockdown or overexpress certain proteins. The long-term goal is to better understand how GCs affect muscle. This study may identify a new therapeutic target for muscle weakness. The specific aims are to: (1) determine which GR ligand proteins are required for GRs to influence muscle function and morphology, (2) determine which GRs and MRs are expressed in muscle, and (3) determine the effect of GCs on muscle. The significance of the work proposed is that GCs regulate the expression of genes important for muscle mass, and that this expression is altered in muscle weakness. This will lead to a better understanding of the molecular changes associated with muscle weakness. [unreadable] [unreadable] [

What's New in the?

XML Schema Quality Checker is a tool that diagnoses incorrect uses of the XML Schema specification in a schema, showing the specific portion of the schema that is wrong, and indicating how to correct the problem. Quality Checker takes as input an XML Schema written in the W3C XML schema language (XSD), and may be used to quality check individual XML documents or a whole group of XML documents. XML Schema Quality Checker may be used in several modes: 1. In "individual schema document" mode, XML Schema Quality Checker reports problems with the input schema as soon as they are detected. The developer is then free to inspect the indicated part of the schema, to understand why it is erroneous, and to fix the problem. This mode may be especially useful to spot errors in a schema document that is to be used in an individual application, such as a web site, a XML web service, or a database access application. 2. In "schema collection" mode, XML Schema Quality Checker identifies as many erroneous or erroneous portions as it can, and when it has done this, reports a summary of the erroneous areas, along with a list of the messages. This mode may be useful when a developer is working on a whole group of XML schemas, where a tool like this could be run repeatedly, to catch errors sooner. 3. In "batch mode", XML Schema Quality Checker checks one or more input XML schemas simultaneously, and then displays all the checked schemas in the same window. In this mode, it is possible to check many schemas at once, which may be useful when there are many XML documents to be checked, or when many XML documents must be checked with a regular interval. XML Schema Quality Checker works best with a clean XML Schema. It cannot report an error in an XML document that uses a schema that has already been checked. There are several checks that are performed on the input schema before XML Schema Quality Checker is run, including checks for: 1. The XML Schema document must be formatted correctly. It is very important that the schema is well-formed, and contains a proper DOCTYPE declaration. You must have this declaration in the first element of the schema. The tool will not check a schema without this declaration. An XML file that is not well-formed will not be checked. 2. The XML document(s) must be valid. XML Schema Quality Checker checks all XML documents that are created from the input schema, and reports all problems that it finds in these documents. Each message is represented as a row in the output
