Contacts: Created by: Robert Tarcza License: GPL 3.0 exo-scanner is a simple tool, for Windows, Linux and Mac OS, used to preview, download, and manage your pictures. With exo-scanner you can: - view any pictures on your device as a normal folder - add pictures from the photos gallery to your device or from a folder on your computer - see previews of your pictures - add pictures from a folder to your device or from your computer - show them on your device with a full screen preview - do anything you want with your pictures Contacts: Created by: Yohann Latuilles License: GNU General Public License 2.0 Stripe is a lightweight, command-line based, online credit card processing application. It provides a simple and effective interface for accepting credit cards online. For the applications that do not need to handle recurring payments, Stripe is an excellent solution for turning a single transaction into a recurring automatic subscription. Command-line Mode: Stripe has several command line switches that enable you to process transactions and list your account information. For example, the following command will create a new transaction for the Jane Doe account: stripe invoice create jane Crossline is an application that will make it easy to quickly add contacts to your phone contacts on your computer. Crossline supports any smartphone and will find any phone and create a new contact. Using Crossline it will also remove contacts you already have added and will keep a backup of your contacts in the folder you define. Contacts: Created by: Etienne Chareton (license: GNU GPL v3 gcontacts-backup is a project that aims to provide a command line tool that will easily backup your Google contacts. The application currently exports the

A quick Google Contacts backup script. A: I wrote a Python3 program to convert CSV files into JSON. You can specify the contacts CSV, email account, and JSON output file. It's really simple, and for each line it's just one line with the full contact (name, phone, etc.), so it's very easy to use. `import sys import json import csv if __name__ == '__main__': # if you have a CSV file with two columns (name, email), name first contact_file = sys.argv[1] email_account = sys.argv[2] output_json_file = sys.argv[3] # parse the csv file, convert it into JSON with open(contact_file, 'r') as infile, open(output_json_file, 'w') as outfile: reader = csv.reader(infile) writer = json.writer(outfile) for row in reader: row[0] = row[0].strip() writer.writerow(row) If you want to backup all contacts from an email account you can use this command, e.g.: $ gcontacts-backup -u me@example.com -p mypassword -d c:\test\ Q: Simple inheritance in javascript I am trying to figure out how inheritance works in javascript. Lets say I have these objects: var foo = function(){ this.obj = {data:"hello"} } var bar = function(){ this.obj = {data:"world"} } I would like foo to have the functionality of bar without creating a subclass. Is this possible? A: Have a look at this example. This is a simple example of subclassing. function Foo() { var foo = this; this.obj = {data:"hello"} }`
